Hiring Manager

April 27, 2026

Re: Application — Software engineer

Dear Hiring Manager,

I am completing a Master of Engineering in Information Technology at École de technologie supérieure (ÉTS). My experience spans backend services, web interfaces, automation, application security, cloud deployment, internal tools, and C++. I work comfortably as a generalist: I learn quickly and adapt to what the team needs. I am targeting roles that combine platform engineering, graphics or real-time software, and broader product delivery. My curriculum vitae summarizes the path; more detail is at antoineboucher.info.

At IMC2 I was a part-time research assistant from March 2025 through February 2026 on a cybersecurity platform hosted on GCP. I contributed to Java services and automated testing, infrastructure changes with Terraform, and running containerized workloads, and helped align Android builds with the same delivery path as backend services. I also worked on analyst-facing tooling for scoring, visualizing, and prioritizing cyber risk at scale. That role touched many parts of one product—backend, security, data, visualization, delivery, and operations—without reducing the job to a single specialty.

I was a teaching assistant for DevSecOps at Polytechnique Montréal (course LOG8100) and for several software-heavy courses at ÉTS. I supported student teams using GitLab, Docker, Kubernetes, Azure, databases, web development, and secure delivery practices. I like explaining problems clearly, unblocking others, and shipping under a fixed schedule.

Earlier I worked on cloud infrastructure at IONODES, Kotlin and Spring services at Intact, and contract web work with Django, Vue, APIs, and observability. Together that gave me a solid base across backend and frontend development, integration, deployment, and maintenance.

For my master's project I am going deeper with C++, OpenGL, and Blender on real-time surface wear simulation in texture space, combining simulation, GPU work, and interactive rendering. That work matches my interest in performance-sensitive systems, reliability, and software quality.

I also publish small open-source projects, including **uml-mcp**, a utility for UML-style diagram generation. I would welcome a conversation about how my background could support your projects, platform, or engineering operations.

Sincerely,

Antoine Boucher
